**Load Regulation** [5]:

For loads  $|1M\Omega| \leq 105V$  add:

$$[(1400/R_{LOAD}) + (C_{LOAD} \times F^2 \times 0.03)] \text{ % of output}$$

For loads  $|1M\Omega| > 105V$  add:

$$[(1400/R_{LOAD}) + (C_{LOAD} \times F^2 \times 0.19 + C_{LOAD} \times 3E7)] \text{ % of output}$$

**Maximum Capacitance** [5]:

## 7.10 % Duty Cycle Function Specifications

### 7.10.1 Introduction

Duty Cycle is a derived (relative) quantity which describes the Pulse Width/Repetition Period ratio of a pulsed waveform, expressed in the 9000 as a percentage. The values of Pulse Width and Repetition Period will change with frequency, while maintaining the same percentage ratio.

Hardware limitations drive the % Duty Cycle to a limit only when the Pulse Width and Repetition Period intervals reach their individual limits at particular frequencies. This means that any accuracy specification must be expressed in terms of constituent time intervals.

### 7.14.1 K-Type Temperature Accuracy

**NOTE:** To calculate the Model 9000's accuracy in °F (Fahrenheit) or K (Kelvin) proceed as follows:-

1. Convert the temperature in °F or K to °C using one of the following formulae as appropriate:

$$^{\circ}\text{C} = \text{K} - 273$$

$$^{\circ}\text{C} = \frac{(^{\circ}\text{F} - 32)}{9} \times 5$$

2. Calculate the Model 9000's accuracy ( $\Delta^{\circ}\text{C}$ ) at this °C temperature from the accuracy table above.
3. Convert  $\Delta^{\circ}\text{C}$  back to °F or K using one of the following formulae as appropriate:

$$\Delta\text{K} = \Delta^{\circ}\text{C}$$

$$\Delta^{\circ}\text{F} = \frac{\Delta^{\circ}\text{C} \times 9}{5}$$

#### Example:

To calculate accuracy at 2000°F

$$^{\circ}\text{C} = \frac{(2000 - 32) \times 5}{9} = 1093^{\circ}\text{C}$$

$$\Delta^{\circ}\text{C} = (0.02\% \times 1093) + 0.5 = 0.72^{\circ}\text{C}$$

$$\Delta^{\circ}\text{F} = \frac{0.72 \times 9}{5} = 1.30^{\circ}\text{F}$$
